

# SQL Server Execution Plans: From Zero to Hero!

Sergio Govoni

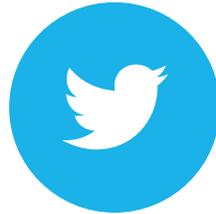

# Goals

- This session is just a guideposts on mechanisms to try to move you in the right direction
- Good starting point to
  - Capture query execution plans
  - Understand which are the most important pieces of an execution plan
  - Learn where to go to see first!

# Speaker Bio

Sergio Govoni

# Agenda

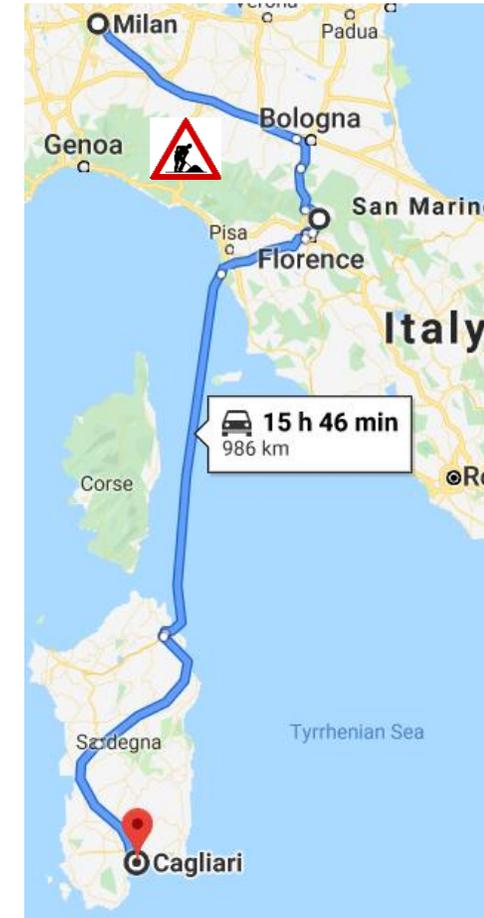

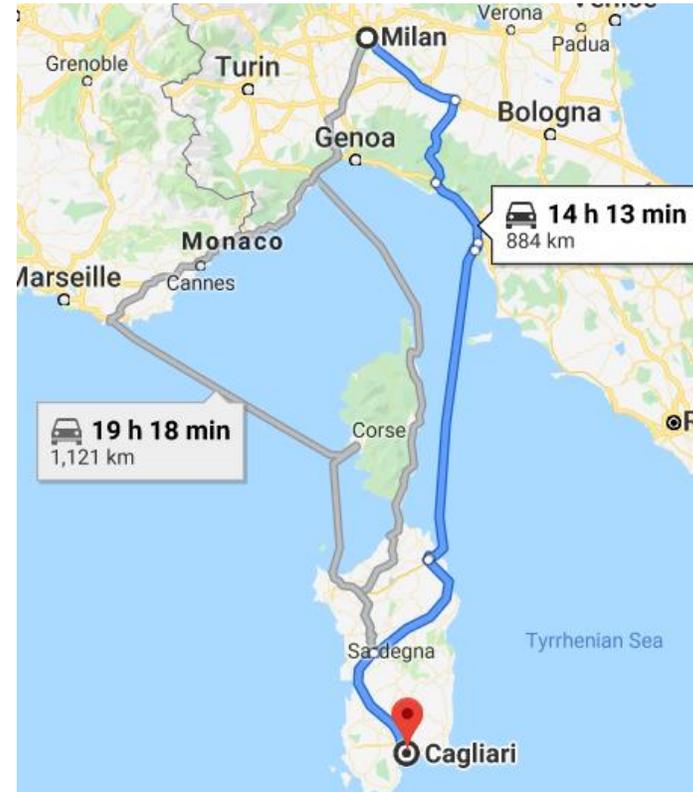

- Execution Plan
  - Fundamentals
  - Behind the scenes of a query
  - How to capture an execution plan
  - Logical and physical operators
  - The Execution Plan of an “Update” statement (I/U/D)
  - Warnings
  - “SARGable” Predicates
  - Index Scan VS Index Seek

# Execution Plans: Fundamentals

- Execution plan is generated by Query Optimizer
  - It helps us to answer the question: Why this query is so slow?
- It contains the instructions to execute a query
  - Table access order
  - Join operator
  - Indexes
- It defines the most efficient way to access data
- SQL Server stores the execution plans for reuse

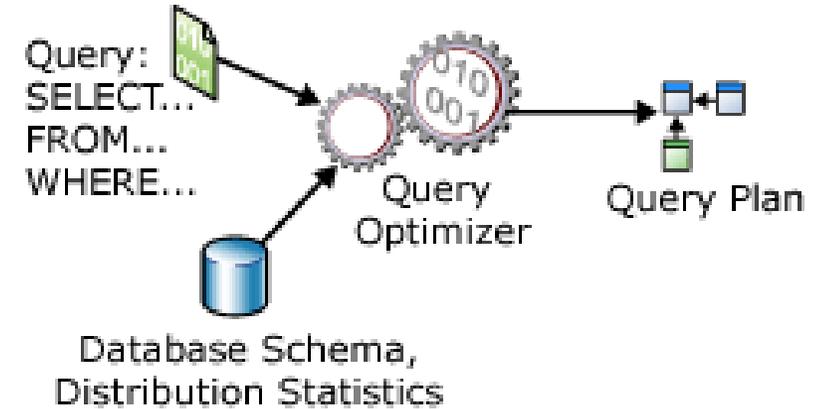

# Execution Plans: Fundamentals

- Two types
  - Estimated Execution Plan
  - Actual Execution Plan
- Three formats
  - Graphical Plans
  - Text Plans (deprecated)
  - XML Plans
- Where you can find them?
  - SSMS, SQL Profiler, DMV
  - Extended Events, Query Store

# Behind the scenes of a query

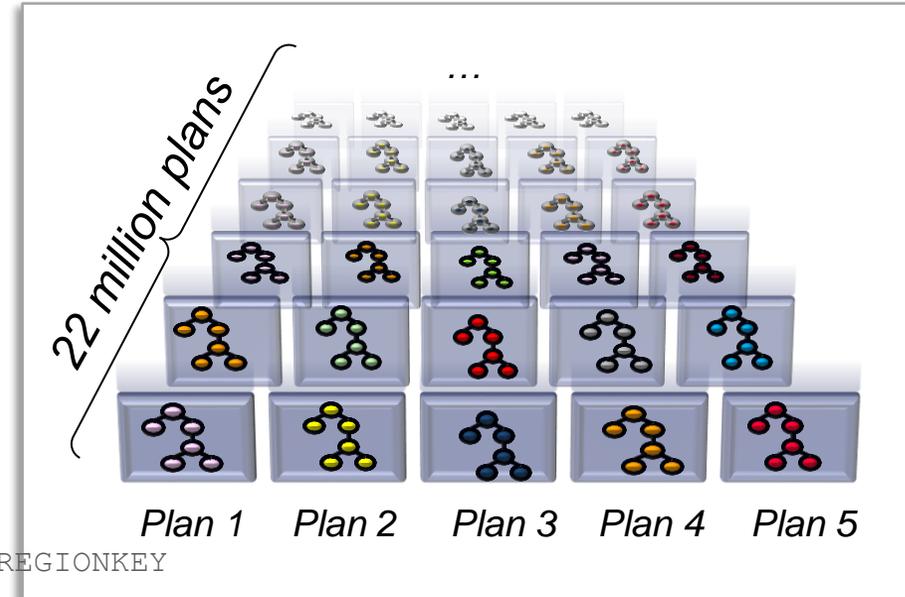

- Query Parsing
  - Logical operator tree
- Query Optimizer
  - It turns a query into an execution plan. T-SQL is a declarative language, developers are used to declare **what they want**, the Query Optimizer finds **how to implement** the request, physically
- Query Execution

# Cost-based Plan

From David DeWitt keynote at PASS Summit - <http://bit.ly/1emLOuj>

```
Select o_year,  
sum(case  
  when nation = 'BRAZIL' then volume  
  else 0  
end) / sum(volume)  
from  
(  
  select YEAR(O_ORDERDATE) as o_year,  
         L_EXTENDEDPRICE * (1 - L_DISCOUNT) as volume,  
         n2.N_NAME as nation  
  from PART, SUPPLIER, LINEITEM, ORDERS, CUSTOMER, NATION n1,  
         NATION n2, REGION  
  where  
    P_PARTKEY = L_PARTKEY and S_SUPPKEY = L_SUPPKEY  
    and L_ORDERKEY = O_ORDERKEY and O_CUSTKEY = C_CUSTKEY  
    and C_NATIONKEY = n1.N_NATIONKEY and n1.N_REGIONKEY = R_REGIONKEY  
    and R_NAME = 'AMERICA' and S_NATIONKEY = n2.N_NATIONKEY  
    and O_ORDERDATE between '1995-01-01' and '1996-12-31'  
    and P_TYPE = 'ECONOMY ANODIZED STEEL'  
    and S_ACCTBAL <= constant-1  
    and L_EXTENDEDPRICE <= constant-2  
  ) as all_nations  
group by o_year order by o_year
```

# How to capture an Execution Plan

- Estimated plan
  - SET SHOWPLAN\_TEXT (deprecated)
  - SET SHOWPLAN\_ALL (deprecated)
  - SET SHOWPLAN\_XML
  - Display Estimated Execution Plan in SSMS
  - DMVs
    - sys.dm\_exec\_query\_plan
    - sys.dm\_exec\_text\_query\_plan
  - SQL Server Query Store

# How to capture an Execution Plan

- Actual plan
  - SET STATISTICS PROFILE (deprecated)
  - SET STATISTICS XML
  - Include Actual Execution Plan in SSMS

# Demo

How to capture an execution plan

# Logical and physical operators

# The icon-based language

- Learning how to read execution plans is like learning a new icon-based language 😊
- More than 120 operators in SQL Server 2019
  - We will learn the most common/used ones
  - The complete list is available on Microsoft docs <https://bit.ly/2Jrnde1>

# The icon-based language

Icon							
$\frac{A}{(B+C)}$							A↔B
							A→B
							T-SQL

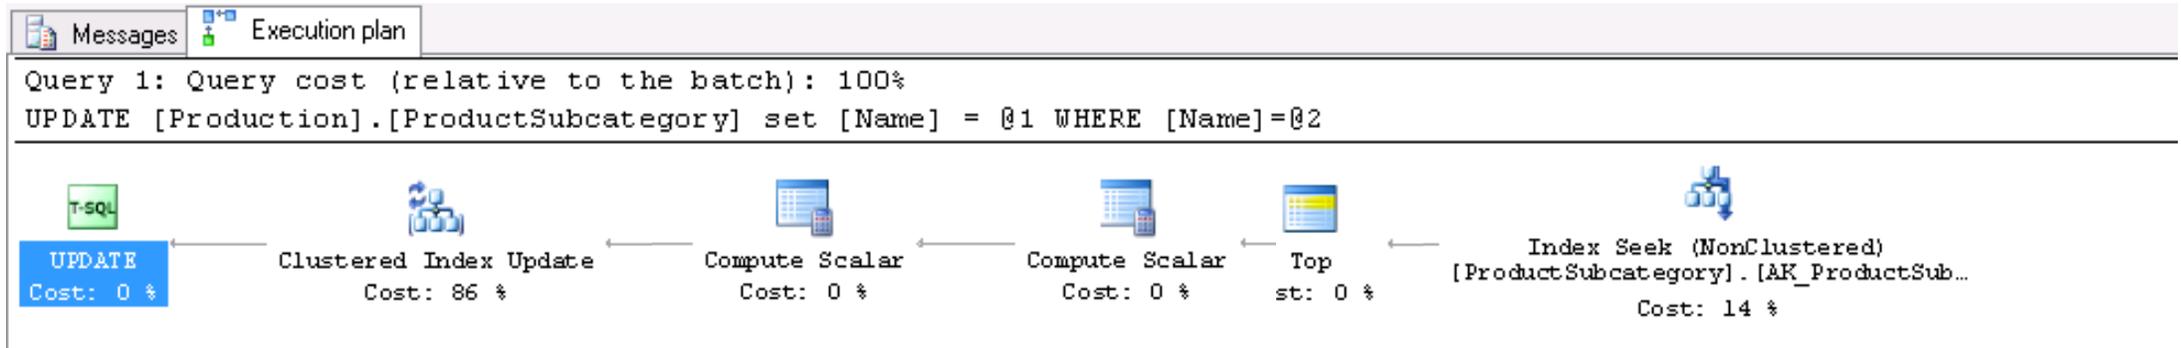

Icon-overlay when an operator is executed in parallel mode

# Demo

Logical and physical operators

# The Execution Plan of an “Update”

# The Execution Plan of an “Update”

- Update (I/U/D/M) execution plan
  - Find rows to be update, check all constraints
- Some calculations
- Perform the update

# Demo

The Execution Plan of an “Update”

# Warnings

# Warnings

- No statistics (ColumnsWithNoStatistics)
- No join predicate (NoJoinPredicate)
- Implicit conversions (PlanAffectingConvert)
- Sort on tempdb (SpillToTempDb)
- No matched indexes (UnmatchedIndexes)
- Wait (WaitWarningType)
  
- Check the showplanxml.xsd

# Demo

Warnings

# SARGable Predicates

# SARGable Predicates

- Sargable is a strange term, it is an abbreviation of SARG which stands for **S**earch **ARG**ument
- Sargable means that the predicate can be evaluated/executed using an Index Seek
- Predicates
  - ✗ `<expression> <operator> <expression>`
  - ✓ `<column> <operator> <expression>`

# SARGable Predicates

-- SARGable

WHERE StockItemID = 104

-- NON SARGable

WHERE StockItemID ~~+~~ = 104

-- SARGable

WHERE StockItemName = 'DBA joke mug - it'

-- NON SARGable

WHERE ~~UPPER~~(StockItemName) = UPPER('DBA joke mug - it')

-- ???

WHERE StockItemName LIKE 'DBA%'

# Demo

SARGable Predicate

# Index Scan vs Index Seek

# Index Scan vs Index Seek

- Index scans are not necessarily bad
- Index seeks are not necessarily good
- It depends!!
- Pay attention to
  - Scans
  - Estimated number of executions
  - Number of executions

# Demo

Index Scan vs Index Seek

# Tools

- SentryOne Plan Explorer
  - Download: <https://bit.ly/2oBSbVY>
  - Post on UGISS: <https://bit.ly/2UcYq27>
  - Add-in available for SQL Server Management Studio and Azure Data Studio

# Topics not covered in this session

- Optimization process
  - Search 0, Search 1, Search 2
  - Transformation rules
  - Trace Flags
- Intelligent Query Processing
- Parallelism
- How to force Query Optimizer
- Plan cache
- New Cardinality Estimator in SQL 2014+

# Resources

# Take Your Career to New Heights

## Save \$150 USD

Register for PASS Summit 2020 and as a participant in **UGISS**, you can **save \$150 USD** the registration price.

To claim use code\* **LGDISCL1Y**.

\* Unique discount code cannot be applied retroactively and cannot be combined with any other offers.

# Thank You!
